

# REPRODUCIBLE RESEARCH: A PERSPECTIVE

---

Arnaud Legrand

Univ. Grenoble Alpes, CNRS, Inria, Grenoble INP

UFRGS, October 2019

- *RR mainly allows to fight scientific misconduct (e.g., fraud).  
That's nice but I'm honest so just let me do my work!*

## COMMON BELIEFS

- *RR mainly allows to fight scientific misconduct (e.g., fraud).  
That's nice but I'm honest so just let me do my work!*
- *RR is all about re-executing the same code, even if the code is stupid and makes wrong computation. It's pointless!*

## COMMON BELIEFS

- *RR mainly allows to fight scientific misconduct (e.g., fraud). That's nice but I'm honest so just let me do my work!*
- *RR is all about re-executing the same code, even if the code is stupid and makes wrong computation. It's pointless!*
- *My student has done everything with org-jupyter-studio-mode. Now he's gone and I can't reuse what he did. See, what's the point? RR does not help!*

## COMMON BELIEFS

- *RR mainly allows to fight scientific misconduct (e.g., fraud). That's nice but I'm honest so just let me do my work!*
- *RR is all about re-executing the same code, even if the code is stupid and makes wrong computation. It's pointless!*
- *My student has done everything with org-jupyter-studio-mode. Now he's gone and I can't reuse what he did. See, what's the point? RR does not help!*
- *RR is about controlling and checking everything, which slows down the scientific discovery process. Changing the way we work and publish may be harmful!*

## Claerbout & Karrenbach, meeting of the Society of Exploration Geophysics, 1992

### Electronic Documents Give Reproducible Research a New Meaning

RE1.3

Jon F. Claerbout and Martin Karrenbach, Stanford Univ.

#### SUMMARY

A revolution in education and technology transfer follows from the marriage of word processing and software command scripts. In this marriage an author attaches to every figure caption a pushbutton or a name tag usable to recalculate the figure from all its data, parameters, and programs. This provides a new level of reproducibility in computing.

In 1990, we set this sequence of goals:

- Learn how to merge a publication with its underlying computational analysis.
- Teach researchers how to prepare a document in a form where they themselves can reproduce their own research results a year or more later by "pressing a single button".
- Learn how to leave finished work in a condition where coworkers can reproduce the calculation including the final illustration by pressing a button in its caption.
- Prepare a complete copy of our local software environment so that graduating students can take their work away with them to other sites, press a button, and reproduce their Stanford work.
- Merge electronic documents written by multiple authors (SEP reports).

- make incremental improvements in electronic-document software
- seek partners for broadening standards (and making incremental improvements).

Our basic goal is reproducible research. The electronic document is our means to this end. In principle, reproducibility in research can be achieved without electronic documents and that is how we started. Our first nonelectronic reproducible document was a textbook in which the paper document contained the name of a program script in every figure caption. The program scripts were organized by book chapter and section so they could be correlated to an accompanying magnetic tape dump of the file system. The magnetic tape also contained all the necessary data to feed the program script.

Now that we have begun using CD-ROM publication, we can go much further. Every figure caption contains a pushbutton that jumps to the appropriate science directory (folder) and initiates a figure rebuild command and then displays the figure, possibly as a movie or interactive program. We normally display seismic images of the earth's interior, but to reach wider audiences, Figure 1 shows a satellite weather picture which the pushbutton will animate as seen on commercial television. We include all our plot software as well as freely available software from many sources, including compilers and the  $\text{\LaTeX}$  word processing system. Naturally we must include licensed software, but with the exception

# UNFORTUNATE MISTAKES

**Geoffrey Chang** (Scripps, UCSD) works on crystallography and studies the structure of cell membrane proteins. He specialized in structures of **multidrug resistant transporter proteins in bacteria**: MsbA de Escheria Choli (Science, 2001), Vibrio cholera (Mol. Biology, 2003), Salmonella typhimurium (Science, 2005)

**2006:** Inconsistencies reveal **a programming mistake**

*a homemade data-analysis program had flipped two columns of data, inverting the electron-density map from which his team had derived the protein structure.*

**5 retracts** that motivate improved software engineering practices in computational biology

# WHISTLE BLOWING

"clinical trials in oncology have the highest failure rate [only 5% are licensed] compared with other therapeutic areas [...] difficulty to repeat experiments even in the laboratory of the original investigator"

Begley and Ellis, Nature, 2012. *Raise standards for preclinical cancer research*

8 ACM conferences and 5 journals  
EM<sup>no</sup> = the code cannot be provided

Collberg, Christian et al., *Measuring Reproducibility in Computer Systems Research*, 2015

The scientific process demands the highest standards of **quality**, **ethics** and **rigor**.

# WHY ARE SCIENTIFIC STUDIES SO DIFFICULT TO REPRODUCE?

## HAVE YOU FAILED TO REPRODUCE AN EXPERIMENT?

Most scientists have experienced failure to reproduce results.

1,500 scientists lift the lid on reproducibility,

Nature, May 2016

## Social causes

- Fraud, conflict of interest (pharmaceutic, ...)
- No incentive to reproduce/check our own work (afap), nor the work of others (big results!), nor to allow others to check (competition)
- Peer review does not scale: 1+ million articles per year!

## HAVE YOU EVER TRIED TO PUBLISH A REPRODUCTION ATTEMPT?

Although only a small proportion of respondents tried to publish replication attempts, many had their papers accepted.

## Methodological or technical causes

- The many biases (apophenia, confirmation, hindsight, experimenter, ...): bad designs
- Selective reporting, weak analysis (statistics, data manipulation mistakes, computational errors)
- Lack of information, code/raw data unavailable

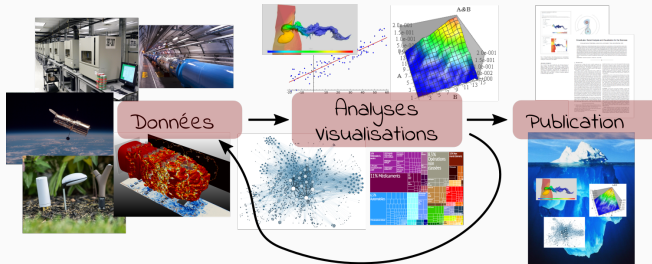

Number of respondents from each discipline:  
Biology 703, Chemistry 106, Earth and environmental 95,

# DIFFERENT CONCERNS

**Social Sciences, Oncology, ...** methodology, statistics

**Genomics** software engineering, computational reproducibility, provenance, ...

**Computational fluid dynamics** numerical issues

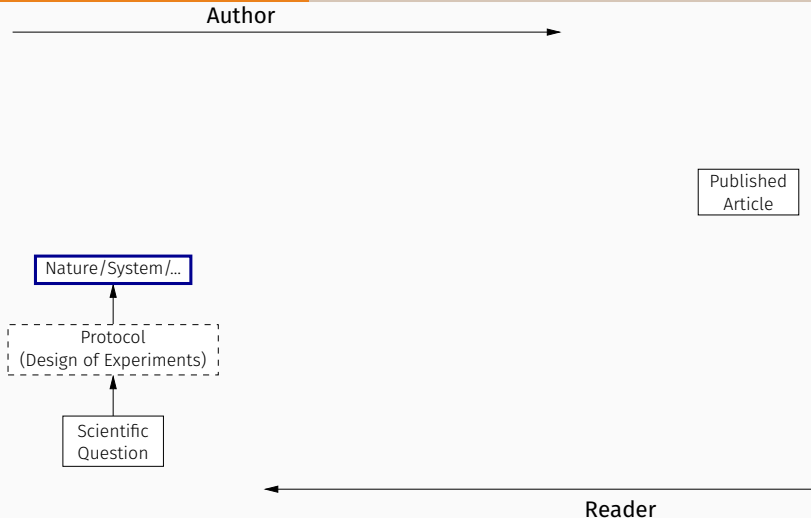

Distinguish between:

- experimental science
- observational science
- computational science (simulation)
- (big) data analysis
